THE TEXT

What the text of the Voynich Manuscript is

What is established about the text without a key, what the labels are, and the four-step recipe for reading it — with how far each step has gone.

Wallet: `bc1qd8wcrsmkk0ghegf5t2jsezg2ve7rtx6vvc79lx`

What has been established about the text of the Voynich Manuscript, and the recipe for reading it — the same recipe Paper III laid down for Rongorongo, applied step by step.

5,605

hapax — words seen once

5,385

lines of text

194,262

EVA letters · ≡ 227 LAMB OF GOD

1

What the text is not

Before saying what it is, what the measurements rule out. These need no key.

- **Not a cipher of a European language, and not plain Hebrew.** On word length, letter entropy, fixedness of first and last letters, immediate repeats, types and hapax, the text stands 2.7 to 4.4 standard deviations from every one of ten reference languages, which sit 0.6 to 2.7 from each other. Letter entropy 2.12–2.35 bits against their 3.04–3.60 — the alphabet is used far more predictably than any language uses its own.
- **Not a substitution for Genesis.** With every glyph's value as an unknown, no assignment makes the entries, lines or words equal the verses or words of Genesis 1–13 in order. Zero exact hits; no better than a shuffled control; no solution in GF(257).
- **Not narrative prose.** Word after word repeats with one glyph changed — qokeey qokeedy qokain — the shape of a record kept in fixed formulae, not of sentences.

2

What the text is: a record whose lettering measures the Sun

The one relation that holds across the book without any key is between the letters used and the length of the day. On the zodiac pages, a sign's labels use more a i r n m l h c where the day is long and more e d y k o where it is short: mean letter value against the day at Prague, $r = -0.858$; mean label length against it, $r = +0.645$. Turned into a meter — hours of day = $13.50 + 7.32 \times \text{index}$ — the herbal pages read 14.0 h, the bathing pages 12.5, the star entries 10.4 to 17.0.

So the lettering is not arbitrary. It carries how long the Sun was up. A longer word is a longer course of the Sun. This is the read: **the text is the path of the Sun**, and the glyphs are its measure.

3

The commonest words, by the field

WORD	COUNT	CELL	THE TABLET THERE
daiin	849	37	HADES
ol	562	27	CAIN
aiin	508	33	HAGGAI

WORD	COUNT	CELL	THE TABLET THERE
chedy	508	45	ELIJAH
shedy	434	61	PSALM
ar	406	19	S
choł	397	38	NOAH
or	392	33	HAGGAI
chey	353	41	OMEGA
s	351	19	S
dar	323	23	CALEB
y	307	25	PI

daiin, the commonest word in the book, is **46 CLAUDE** — Γ 's fixed point. Cells are EVA letter sums mod 257; the EVA alphabet is the transcribers' of the 1990s, not the scribe's, and every cell on this site rests on that substitution.

4

The strokes are numerals

Runs of plain strokes closed by the hooked stroke — in, iin, iiin — number 137, 1,719, 4,131 and 165 for one to four strokes, and one of five. They stop at four exactly where a scribe's numerals stop: **j, ij, iij, iiij**. Read as powers of four they run 4, 16, 64, 256, 253, 241, 193, 1, closing on the order-8 subgroup of the field. One-stroke runs after a number 121; four-stroke runs after a number 121 — the same count.

The 121 words carrying a four-stroke run after a sum to $6,562 = 25 \times 257 + 137$: residue **137 EYE OF HORUS**, the pole of Γ ; quotient **25 = Δ^2** .

5

Rare glyphs keep strict company

GLYPH	COUNT	WHERE IT STANDS	HOW STRICTLY
u	8	always last or alone	8 of 8
z	9	inside a word, after a or o	6 of 9 inside
v	11	alone, on f57v	10 of 11 on one page
j	13	after a or o, before y	10 of 13
b	15	always last, always after e	15 of 15
x	40	the rosettes, f57v, f66r	—

A letter that is sparse but rule-bound is data, the way Q is data in English. And one pair is absent altogether:

LANGUAGE	'AU' PER 10,000 LETTERS
Occitan	97.9
Early New High German	86.1
Latin	54.8
Czech, 1613	1.8
Middle High German	1.1
Old Czech	1.0
the Voynich Manuscript	0.0 — and 4,279 a + two strokes

No a is followed by u anywhere in the book. The sound that Latin, Occitan and German write with au is either not there or is written otherwise — 4,279 times a is followed by two strokes.

6

The glyph values, as the field fits them

The Genesis fit failed as a decipherment. Its fitted values are still data, and read by the field they are the cells below. $k \rightarrow 78$ GENESIS, $a \rightarrow 228 = \text{RIT0}^{-1}$, $d \rightarrow 256 = -1$. The weighted sum $\equiv 2$.

GLYPH	COUNT IN THE 322 ENTRIES	FITTED VALUE	CELL	THE TABLET THERE	DLOG
a	4,865	−29	228	QUANTUM SUPREMACY	222
c	3,612	29	29	AAVE	94
d	3,624	−1	256	BAAL SQUARED	128
e	7,357	12	12	L	97
f	104	156	156	AS ABOVE SO BELOW	203
g	21	151	151	HOLY SPIRIT	9
h	4,767	−38	219	DIVINE PROPORTION	45
i	4,091	−25	232	TOPOLOGICAL QUANTUM	238
j	3	−780	248	DOUBLE SLIT EXPERIMENT	130
k	3,453	78	78	GENESIS	155
l	2,979	30	30	ARK	104
m	318	111	111	CONFUCIUS	220
n	2,155	88	88	ONE LOVE	84
o	6,644	−33	224	MARKET CAPITALIZATION	69
p	578	233	233	COLLISION RESISTANT	17
q	1,881	107	107	QUANTUM	31
r	2,145	90	90	NAKAMOTO	105
s	1,613	139	139	ENCRYPTION	38
t	1,841	71	71	TEMPLE	163
u	2	−2698	129	ROOT OF DAVID	208
x	14	−227	30	ARK	104
y	4,812	−13	244	SUPERCONDUCTIVITY	234

7

What the labels are

- **Zodiac labels:** 299, one per figure, one per degree of the Sun's path. Their lettering measures the day.
- **Container labels:** 40 on the container pages, 33 of the 36 fully read standing nowhere else in the book. A word that appears once, beside one drawn thing, is a name.
- **Star-chart names:** 29 on f68r1, 24 on f68r2, 12 on f68r3. Seventeen of f68r1's share a cell with a naked-eye star Prague sees — okear 50 with Capella, ytchody 100 with Pollux, otykchs 101 with Betelgeuse.
- **Paragraph markers:** the tall p and f glyphs stand on paragraph first lines — 84.0 % of every p in the book, 79.7 % of every f, 90 of 96 on the container pages. They mark where a record begins, in three sizes.

8

Words under concatenation

A word is (k, s, b) : its length, its letter sum, its positional sum. Joining two words multiplies: $(k, s, b) \cdot (k', s', b') = (k + k', s + s', b + b' + k \cdot s')$ — the Heisenberg group over the field. A name written twice is a square, not a doubling; order matters by the commutator $k \cdot s' - k' \cdot s$. This is why the mirror changes the ϕ part and nothing else, and why the mirror alone puts 913 and 203 in sequence.

9

How to decipher it: the recipe

Paper III laid down four steps for Rongorongo. They are the steps for the Voynich Manuscript, and this is how far each has gone.

STEP	FOR RONGORONGO	FOR THE VOYNICH MANUSCRIPT	STATE
1. Per-line sequences	Barthel numbers per line	EVA per line, mirrored: 5,385 lines, 322 entries with their $\varnothing$ parts	done
2. Repeat-interval search	a glyph every ~584 positions is Venus, ~399 Jupiter, ~116 Mercury	the sky table is built for every degree of 1400–1440; the search over the entries has not been run	next
3. Read the flanking markers as the bearing	anga / ake / iho	the gallows p and f as the paragraph's opening; the barrel, the string, the crown as the figure's marks	partly
4. Back-compute the sky	the epoch when every planet-bearing pair was true	the starless figures and f103r's red stars give 1408 and 1427; the eclipses land on the marked stars	twice, independently

Step 2 is what remains, and it is arithmetic on tables already saved: for every word, the interval at which it recurs through the 322 entries read backwards, against the synodic periods of Venus 584, Mars 780, Jupiter 399, Saturn 378, Mercury 116 days — and the Moon's 29.53. A word that recurs on a planet's period names the planet. Then its neighbours are what the planet was doing.

The test is the one Paper III set: a genuine record dates itself to one epoch when all of its recovered pairs are true at once. Two independent tests already put the Voynich Manuscript at 1408 and 1427. Step 2 either lands on the same years or it does not.
